

**ACOM's EZWebForms is an eBusiness solution that connects you to all of your customers, employees, and partners who have Internet access.**

## **EZWebForms...**

- Is a Web-based communication and data management platform, providing a secure, Internet-based system for transporting documents between trading partners, using the Internet and Web technology.
- Presents data from any SQL database, flat file, EDI or XML file, and delivers the completed documents to the Web. EZWebForms can also format data and deliver it to partners, customers and employees via email or fax.
- Can be interpretive, accepting new data through browser input, or creating response documents (like purchase order acknowledgements or responses to quotes). Business rules for the respective forms are enforced within the forms themselves.
- Enables you to post your own interactive web forms, using XML with XSL style sheets. Trading partners access these forms for buying, selling and collaborating, simply with Internet capability and a browser. Little training or experience is required, since the forms are self-explanatory and are provided with response/turnaround capability.
- Extends the power of e-commerce to your entire range of customers. It doesn't matter whether your trading partners are large or small, regular or occasional customers, eBusiness-enabled or not. EZWebForms is the perfect solution for universal e-business connectivity between trading partners; it is scaleable from high-tech to low-tech to no-tech environments. **You** create the environment. Your trading partners share in it. Both sides do business better, faster, more secure, and at a lower cost.
- Is the ultimate platform-independent eBusiness solution, since it allows any trading partner with access to the Web to begin doing business electronically, immediately. It extends the power of eCommerce to your entire range of customers or suppliers with minimal implementation effort on your part, none on theirs.

### **Real-World Solutions**

- Companies can leverage existing EDI systems by converting EDI files/PO's to the Web for low technology suppliers.
- Companies can distribute commission statements and sales reports to a geographically dispersed sales force.
- Companies can manage and archive any number of business documents needed for internal use, such as expense reports or human resources forms.

## Application Features

- Access and security are controlled by user ID & password
- Accounts are accessible by multiple users, with several levels of access control
- Users accessing the WebForms via the browser have the option of reading, updating, printing or archiving the document
- Extensive Search, Sort and Filtering criteria
- Configurable functional acknowledgment generation: automatic or when-viewed
- Turnaround documents with business rule validation support
- Approval lists (Chain, Any, All)
- XML-based web forms with XSL style sheets
- Multiple mailboxes with Archive, Delete and Restore capabilities
- View forms as HTML or PDF

## Compatibility Features

- Compatible with multiple data standards: EDI (X12) and most XML standards, including:
  - ◆ SAP
  - ◆ RosettaNet (Partnership Interface Process)
  - ◆ cXML
  - ◆ xCBL
  - ◆ eb/XML
  - ◆ Biztalk (Microsoft)
  - ◆ and others
- Transports supported: HTTP/S, FTP/S, VAN, EDI-INT (AS2), EMAIL, FAX, PROPRIETARY, POINT-TO-POINT

## Requirements

- Windows Server 2003 or Windows Server 2008
- MS SQL Server
- EZConnect 9.0 software
