

Overview:

This new add-on module is used in conjunction with EZSplitter/400, and enables you to take the split spool files, with indices, and convert the spool files to PDF, create an index file, and pass this to your IFS. From there, EZContentManager will import these documents and index files to the repository for storage.

EZReporter/400 can also be used to automatically distribute converted spool files to directories on the IFS or PC/LAN directories as they are created. It creates a database that contains detailed information on the spool files and reports that were converted, which includes description, spool file name, number of pages, form type, creation date, etc.

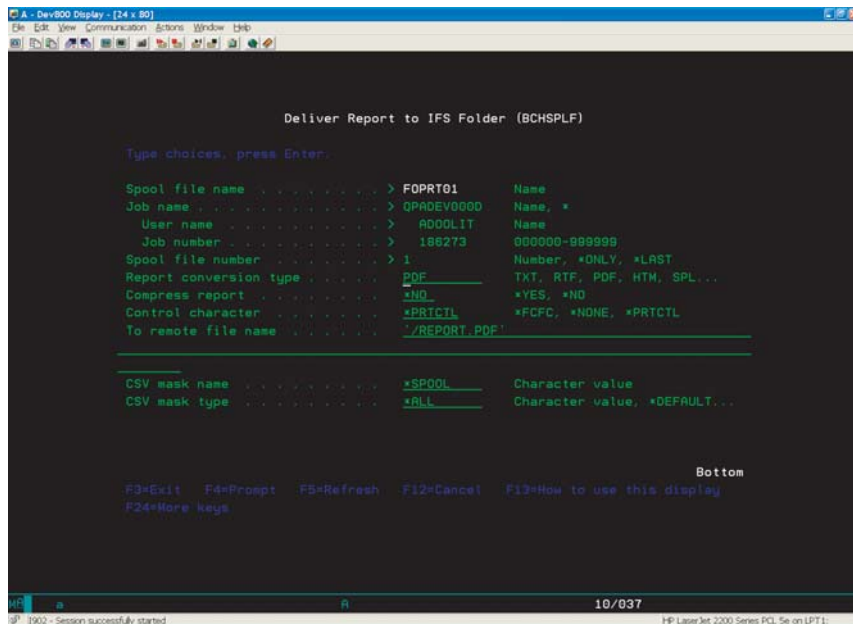

Spool files are automatically converted to desired formats to pass to the IFS or PC/LAN directories with associated index fields.

Features:

- Native iSeries application
- Spool files can be automatically converted and index fields pulled out
- Spool files can be automatically encrypted and compressed upon download to directories
- File names are automatically assigned
- Spool files and reports can be automatically converted to ASCII, PDF, RTF, HTML or CSV
- Can be run interactively or in batch

Benefits:

- Instant ROI by decreasing costs associated with printing and storing large spool files or redundant information
- Easy to use
- Used in conjunction with EZSplitter/400 to pass converted spool files and indices to EZContentManager or any content management solution

Minimum requirements:
 OS version V4R5 or higher
 TCP/IP connectivity
